

How to Choose the Right Solution

Answering these simple questions will help you to decide which application is the best fit for your site.

Re-Works

The unfortunate reality of using standard applications is that there is a high chance that areas will need to be reworked and maintained. These costs can also increase the total price significantly. Re-works and maintenance costs are rarely thought of at the beginning of the tender process however, these are issues that are likely to cause problems and excess expenses on the back-end of your project.

What Materials Affect Price?

- Cellulose Fibre - the mulch, which absorbs or repels water.
- Binder - works to form a cover on the surface, protecting the seed.
- Fertiliser - can be organic and/ or inorganic and used as pellets. Liquids are no longer considered as effective.

How Do I Do This the Right Way?

Choose an application that satisfies your client's specifications and performance expectations. Then decide on what you need to do to get client acceptance.

Which Application is the Most Economical?

This is not always the cheapest. Focus on which is suitable for the site (ameliorated), addresses re-works and maintenance, meets your client expectations and achieves sign-off.

What Do I Need to Know to Make the Right Decision?

Just ask for a detailed breakdown from the supplier, determine a figure for re-works and maintenance and compare prices!
